

Dobby Ads Full Stack Developer Assignment

Deadline: 72 Hours (3 days)

Overview

Create a web application where users can register, create folders, and upload images inside folders. Users should have the ability to create nested folders similar to Google Drive.

Features to Implement

1. Signup
2. Login
3. Logout
4. Create Nested Folders
5. Folder Size
 - Each folder must display its total size, calculated by summing the size of all images it contains, including images inside nested folders at any depth.
6. Upload Image
 - Required fields: Name, Image
7. User-Specific Access
 - Users can only see the folders and images they have uploaded.

Tech Stack

- Back End: NodeJS
- Front End: ReactJS
- Database: MongoDB

Additional Requirements

- The code must be pushed to a GitHub repository.
- The application must be deployed.
- Provide the login credentials for the application when you submit it.
- Authentication must be implemented in NodeJS and the use of Firebase is not allowed.

Bonus (Optional)

Expose one or more backend actions (e.g. create folder, upload image) as MCP-compatible tools. The tools should be structured such that an AI assistant like Claude Desktop can connect to the MCP server and interact with the application through natural language. This is not required but will be evaluated highly if attempted. Example: connecting the MCP server to Claude Desktop and saying “Create a folder called Campaigns inside Projects” should trigger the correct API call in your application.
